

TG360 CELLULAR INFO PROCESS

Laptop Onsite running ThorServer Software Receives the TG360 Data

ThorServer sends TG360 Data to the Internet via a Cellular Modem

Your Phone, Tablet and/or Computer Loads Your TG360 Data

ThorServer is the control center that processes the lightning prediction and detection data from the TG360. TG360 data is sent from ThorServer to our cloud based servers for processing and handling of the data from each customer that is used by ThorTV. ThorMobile/ThorTV updates the lightning prediction and lightning detection data every second with the lightning information and the onsite weather station data is updated every three seconds.

For customers that cannot provide internet access, Thor Guard can supply a cellular modem with the TG360 system. This cellular router would connect to the TG360 router to create the internet connection for data to get to the web and be seen on your phone or computer.

- TG360 ThorServer.....\$1500/yr
- TG360 Cellular Option.....Additional \$1000/yr
